About This Manual

The manual mainly describes the product information, guidelines for installation, operation and maintenance. The manual cannot include complete information about the photovoltaic (PV) system. You can get additional information about other devices at www.sungrowpower.com or on the webpage of the respective component manufacturer.

Applicability
This manual is applicable to the following inverter types:

- SG250HX

They will be referred to as “inverter” hereinafter unless otherwise specified.

Target Group
- Plant owner
- Installation engineer
- Maintenance engineer

How to Use This Manual
Read the manual and other related documents before any work on the inverter is carried out. Documents must be stored carefully and be available at all times.

The contents of the manual will be periodically updated or revised due to the product development. It is probably that there are changes of manual in the subsequent inverter edition. The latest manual can be acquired via visiting the website at www.sungrowpower.com.

Symbols
Important instructions contained in this manual should be followed during installation, operation and maintenance of the inverter. They will be highlighted by the following symbols.

<table>
<thead>
<tr>
<th>Symbol</th>
<th>Explanation</th>
</tr>
</thead>
<tbody>
<tr>
<td>![DANGER]</td>
<td>Indicates a hazard with a high level of risk that, if not avoided, will result in death or serious injury.</td>

1 Safety

The inverter has been designed and tested strictly according to international safety regulations. Read all safety instructions carefully prior to any work and observe them at all times when working on or with the inverter.

Incorrect operation or work may cause:

- injury or death to the operator or a third party; or
- damage to the inverter and other property safety of the operator or a third party.

All detailed work-related safety warnings and notes will be specified at critical points in this manual.

- The safety instructions in this manual cannot cover all the precautions that should be followed. Perform operations considering actual onsite conditions.
- Sungrow shall not be held liable for any damage caused by violation of the safety instructions in this manual.

1.1 PV Panels

DANGER

PV strings will produce electrical power when exposed to sunlight and can cause a lethal voltage and an electric shock.

- Always keep in mind that the inverter is dual power supplied. Electrical operators must wear proper personal protective equipment: helmet, insulated footwear, glove, etc.
- Before touching the DC cables, operator must use a measuring device to ensure that the cable is voltage-free.
- Must follow all warnings on the PV strings and in its manual.

1.2 Utility Grid

Please follow the regulations related to the utility grid.
1.3 Inverter

⚠️ DANGER

Danger to life from electric shocks due to live voltage
- Do not open the enclosure at any time. Unauthorized opening will void guarantee and warranty claims and in most cases terminate the operating license.

⚠️ WARNING

Risk of inverter damage or personal injury
- Do not pull out the PV connectors when the inverter is running.
- Wait 5 minutes for the internal capacitors to discharge. Ensure that there is no voltage or current before pulling any connector.

⚠️ WARNING

All safety instructions, warning labels, and nameplate on the inverter:
- Must be clearly visible;
- Should not be removed or covered.

⚠️ CAUTION

Risk of burns due to hot components!
Do not touch any hot parts (such as heat sink) during operation. Only the DC switch can safely be touched at any time.
NOTICE

Only qualified personnel can perform the country setting.
Unauthorized alteration of the country setting may cause a breach of the type-certificate marking.

Risk of inverter damage due to electrostatic discharge (ESD).
By touching the electronic components, you may damage the inverter. For inverter handling, be sure to:
• Avoid any unnecessary touching;
• Wear a grounding wristband before touching any connectors.

<table>

</tr>
</tbody>
</table>

1.4 Skills of Qualified Personnel

All installations should be performed by technical personnel. They should have:
• Training in the installation and commissioning of the electrical system, as well as the dealing with hazards;
• Knowledge of the manual and other related documents;
• Knowledge of the local regulations and directives.
2 Product Introduction

2.1 Intended Usage

SG250HX, a transformerless three-phase PV grid-connected inverter, is an integral component in the PV power system.

The inverter is designed to convert the direct current power generated from the PV modules into grid-compatible AC current and feeds the AC current to the utility grid. The intended usage of the inverter is illustrated in Fig. 2-1.

![Fig. 2-1 Inverter application in PV power system](image)

**WARNING**

Inverter cannot connect the PV strings whose positive and negative terminals need to be grounded.

Do not connect any local load between the inverter and the AC circuit breaker.

</tbody>
</table>

2.2.5 DC Switch
The DC switch is used to disconnect the DC current safely whenever necessary.

The SG250HX is equipped with four DC switches, each DC switch controls its corresponding DC terminals.

![Fig. 2-4 Bottom view of the SG250HX](image)

2.3 Circuit Diagram
The MPPT is utilized for DC input to ensure the maximum power from the PV array at
different PV input conditions. The inversion circuit converts the DC power into AC power and feeds the AC power into the utility grid through the AC terminal. The protection circuit is equipped to ensure the safe operation of the device and personal safety.

Design principles of the inverters are as follows:

![Circuit diagram](image)

**Fig. 2-5 Circuit diagram**

### 2.4 Function Description

The inverter is equipped with the following functions:

- **Inversion function**
  The inverter converts the DC current into grid-compatible AC current and feeds the AC current into the grid.

- **Data storage**
  The inverter achieves the running information, fault records and etc.

- **Parameter Configuration**
  The inverter provides various parameter settings. You can set the parameters via the phone's APP to change the requirements of the device or optimize the performance of the device.

- **Communication Interface**
  Standard RS485 port can be connected to monitoring a device and PV system.

- **Protection Function**
  The protective functions are integrated in the inverter, including anti-island protection, LVRT/ZVRT, DC reversed polarity protection, AC short circuit protection, leakage current protection, DC overvoltage/overcurrent protection, etc.

**PID function**

After the PID function is enabled, the voltage to ground of all PV panels is greater
than 0, that is, the PV panel-to-ground voltage is a positive value.

![Diagram of PV array, inverter, transformer, and grid]

**NOTICE**

Before enabling the PID recovery function, make sure the to-ground voltage polarity of the PV panels meets requirement. If there are any questions, contact the PV panel manufacturer or read its corresponding user manual.

If the voltage scheme for the PID protection/recovery function does not meet the requirement of corresponding PV panels, the PID function will not work as expected or even damage the PV panels.

- Anti-PID function

When the inverter is running, the PID function module rises the potential between the negative pole of the PV array and the ground to a positive value, to suppress the PID effect.

- PID recovery function

When the inverter is not running, the PID module will apply inverse voltage to PV panels, to restore the degraded PV modules.

- If the PID recovery function is enabled, it only works at night.
- After the PID recovery function is enabled, the voltage of the PV string to ground is 500Vdc by default, and the default value can be modified by the APP.
3  Unpacking and Storage

3.1  Unpacking and Inspection

The inverter is thoroughly tested and strictly inspected before delivery. Damage may still occur during shipping. Conduct a thorough inspection after receiving the device.

• Check the packing case for any visible damage.
• Check the inner contents for damage after unpacking.
• Check the delivery scope for completeness according to the packing list.

Contact SUNGROW or the distributor in case of any damaged or missing components.

It is the best choice to store the inverter in the original packing case. So, do not dispose of it.

3.2  Identifying the Inverter

The nameplate can be found on both the inverter and the packing case. It provides information on type of inverter, important specifications, marks of certification institutions, and serial number which are available and identified by SUNGROW.
**Fig. 3-1** Nameplate

* The image shown here is for reference only. The actual product you receive may differ.

<table>

</tbody>
</table>
3.3 Scope of Delivery

![Image of inverter, mounting bracket, screw-in handle, DC connectors and cord end terminals, four-hole sealing block, M10 fastening screw sets, screws, Allen wrench, and documents]

**Fig. 3-2 Scope of Delivery**

a. The mounting-bracket includes 2 mounting-bracket components and 1 connecting bar.

b. The screws include two M4×10, two M6×65, and two M6×12 hex socket screws.

c. The documents include the quick guidance, packing list, warranty card, etc.

3.4 Inverter Storage

Store the inverter properly when the inverter is not to be installed immediately.

• Store the inverter in the original packing case with the desiccant inside.
• The storage temperature should be always between -40°C and +70°C, and the storage relative humidity should be always between 0 and 95 %, non-condensing.

• In case of stacking storage, the number of stacking layers should never exceed the limit marked on the outer side of the packing case.

• The packing case should be upright.

If the inverter has been stored more than half a year, the qualified personnel should thoroughly check and test it before using.
4 Mechanical Mounting

4.1 Safety during Mounting

⚠️ DANGER
Make sure there is no electrical connection before installation.
In order to avoid electric shock or other injury, be sure there is no electricity or plumbing installations before drilling holes.

⚠️ CAUTION
Risk of injury due to improper handling
• The weight may cause injuries, serious wounds, or bruise.
• Always follow the instructions when moving and positioning the inverter.
System performance loss due to poor ventilation!
• Keep the heat sinks uncovered to ensure heat dissipation performance.

4.2 Location Selection

Selecting an optimal location for the inverter is critical to safe operation, long service life, and sound performance.

With ingress of protection IP66, the inverter can be installed both indoors and outdoors.

The inverter should be installed in a place convenient for electrical connection, operation, and maintenance.
4.2.1 Installation Environment Requirements

- The installation environment is free of inflammable or explosive materials.
- The inverter should be installed in a place inaccessible to the children.
- The ambient temperature and relative humidity should meet the following requirements.

![Temperature Range]

- The inverter should be protected against exposure to direct sunlight, rain, or snow to ensure longer service life.
- The inverter should be well ventilated. Ensure air circulation.
- Never install the inverter in living areas. The inverter will generate noise during operation, affecting daily life.

4.2.2 Carrier Requirements

The installation carrier should meet the following requirements:

![Material and Load Capacity]

4.2.3 Installation Angle Requirements

Inverter vertically or at a minimum back tilt of 10°. Forward installation or upside down installation is prohibited.
In case the installation site is a level surface, mount the inverter to the horizontal-mounting bracket to meet the mounting angle requirements, as shown in the figure below.

- Take the following items into account when designing the bracket scheme:
  - Consider onsite climate conditions and take anti-snow and anti-rain measures if necessary.
  - Ensure that the waterproof connectors are at least 300mm higher than the ground surface. In case the inverter is applied in a floating power plant, ensure that the waterproof connectors are at least 650mm higher than the floating body surface.
  - Bind the cables at the positions 300~350mm away from the DC connector, AC waterproof terminal, and communication waterproof terminal.
  - The various waterproof terminals should be tightened in accordance with the torque requirements in this manual to ensure that they are tight and sealed.
  - Contact SUNGROW if you have any question.

4.2.4 Installation Clearance Requirements

- Reserve enough clearance around the inverter to ensure sufficient space for heat dissipation. (The fans are maintained on the left side of the inverter, and a larger clearance is required.)
• In case of multiple inverters, reserve specific clearance between the inverters.

• In case of back-to-back installation, reserve specific clearance between the two inverters.

• Install the inverter at an appropriate height for ease of viewing LED indicators and operating switches.

### 4.3 Installation Tools

Prepare the following tools before installation:

<table>
<thead>
<tr>

### 4.4 Moving the Inverter

Move the inverter to the specified position before installation. The inverter can be moved manually or via a hoist.
4.4.1 Manual Transport

**Step 1** Release the sealing screws on the mounting ears with a flat-head screwdriver and store them properly. Anchor the four supplied screw-in handles to the mounting ears and base of the inverter.

![Image of manual transport steps]

**Step 2** Lift and move the inverter to the destination by using the side and bottom handles as well as the four installed handles.

**Step 3** Remove the screw-in handles and reassemble the sealing screws released in Step 1.

**CAUTION**
- Inappropriate moving operation may cause personnel injury!
- It is recommended that at least four installers carry the inverter together and wear protective equipment such as smash-proof shoes and gloves.
- Always beware of the gravity center of the inverter and avoid tipping.

**NOTICE**
- The ground surface on which the inverter is to be placed should be covered with a sponge pad, foam cushion or the like to prevent the inverter bottom from scratches.

4.4.2 Hoisting Transport

**Step 1** Release the sealing screws on the mounting ears with a flat-head screwdriver and store them properly.

**Step 2** Anchor two M12 thread lifting rings to the mounting ears of the inverter.
Step 3 Lead the sling through the two lifting rings and fasten the tie-down strap.

Step 4 Hoist the inverter, and stop to check for safety when the inverter is 100mm above the ground. Continue hoisting the device to the destination after ensuring the safety.

Step 5 Remove the lifting rings and reassemble the sealing screws released in Step 1.

⚠️ CAUTION

Keep the inverter balanced throughout the hoisting process and avoid collisions with walls or other objects.

Stop hoisting in the event of severe weather, such as heavy rain, thick fog, or strong wind.

ℹ️ The lifting rings and the sling are not within the delivery scope.

4.5.2 Mounting Steps

Step 1 Assemble the mounting-bracket by using the connecting bar.

Step 2 Level the assembled mounting-bracket by using the level, and mark the positions for drilling holes on the PV bracket. Drill the holes by using a hammer drill.
Step 3 Secure the mounting-bracket with bolts.

Tab. 4-1 Fastening sequence

**Step 7** Hang the inverter to the mounting-bracket and that the mounting ears perfectly engage with the mounting-bracket.
Step 8 Fix the inverter with two M6×65 screws.
5 Electrical Connection

5.1 Safety Instructions

⚠️ DANGER
High voltage may be present inside the inverter!
• The PV string will generate lethal high voltage when exposed to sunlight.
• Do not connect AC&DC circuit breakers before finishing electrical connections.
• Ensure all cables are voltage free before performing cable connection.

⚠️ WARNING
• Any improper operations during cable connection can cause device damage or personal injury.
• Only qualified personnel can perform cable connection.
• All cables must be undamaged, firmly attached, properly insulated and adequately dimensioned.

NOTICE
Comply with the safety instructions related to the PV strings and the regulations related to the utility grid.
• All electrical connections must be in accordance with local and national standards.
• Only with the permission of the utility grid, the inverter can be connected to the utility grid.

5.2 Terminal Description

Wiring terminals are at the bottom of the inverter, as shown in the figure below.
Fig. 5-1 Wiring terminals

5.4 Additional Grounding Connection

⚠ WARNING

- Since the inverter is a transformerless inverter, neither the negative pole nor the positive pole of the PV string can be grounded. Otherwise, the inverter will not operate normally.
- Connect the additional grounding terminal to the protective grounding point before AC cable connection, PV cable connection, and communication cable connection.

5.4.1 Additional Grounding Requirements

All non-current carrying metal parts and device enclosures in the PV power system should be grounded, for example, brackets of PV modules and inverter enclosure.

The additional grounding terminal of the single inverter requires near-end grounding.
When there are multiple inverters, additional grounding terminals of all these inverters and grounding points of the PV module brackets should be connected together first and then to an equipotential line, to ensure equipotential connection. Specific operation depends on onsite conditions.

### 5.4.2 Connection Procedure

**Step 1** Prepare the cable and OT/DT terminal.

1: Heat shrink tubing

2: OT/DT terminal

**Step 2** Fasten the cable with a screwdriver.
5.5 Opening the Wiring Compartment

**Step 1** Release two screws on the front cover of the wiring compartment with supplied Allen wrench.

**Step 2** Open the wiring compartment.

**Step 3** Keep the wiring compartment opened during wiring through the limit lever attached to the cover.

Close the wiring compartment in reverse order after completing wiring operations.

5.6 AC Connection

5.6.1 AC Side Requirements
Before connecting the inverter to the grid, ensure the grid voltage and frequency comply with requirements, for which, refer to "10.1 Technical Data". Otherwise, contact the electric power company for help.
Connect the inverter to the grid only after getting an approval from the local electric power company.

**AC circuit breaker**
An independent three-pole circuit breaker is equipped at the AC side of each inverter to ensure safe disconnection from the grid.

<table>
<thead>
<tr>
<th>Inverter</th>
<th>Recommended rated voltage</th>
<th>Recommended rated current</th>
</tr>
</thead>
<tbody>
<tr>
<td>SG250HX</td>
<td>800V</td>
<td>250A</td>
</tr>
</tbody>
</table>

If multiple inverters need to share a circuit breaker, the circuit breaker should be selected according to the capacity.

**NOTICE**
Never connect a load between the inverter and the circuit breaker.

**Requirements for multi-inverter parallel connection**
If multiple inverters are connected in parallel to the grid, ensure that the total number of parallel inverters does not exceed 28. Otherwise, please contact SUNGROW for technical scheme.

**MV transformer**
The MV transformer used together with the inverter should meet the following requirements:

- The transformer may be a distribution transformer, and it must be designed for the typical cyclical loads of a PV system (load in the day and no load at night).
- The transformer may be of the liquid-immersed type or dry type, and shield winding is not necessary.
- The line-to-line voltage on the LV side of the transformer should endure the output voltage of inverter. When connecting to the IT grid, to-ground withstanding voltage of the LV winding of the transformer, the AC cables, and the secondary devices (including the relay protection device, detection & measuring device, and other related auxiliary devices) should not be lower than 1,500V.
- The line-to-line voltage on the HV side of transformer should comply with local power grid voltage.
- A transformer with a tap changer on the HV side is recommended in order to keep consistent with the grid voltage.
• At an ambient temperature of 45°C, the transformer can run in 1.1 times of load for long time.
• Transformer with a short-circuit impedance 6% (permissible tolerance: ±10%) is recommended.
• The system cable voltage drop is no more than 3%.
• The DC component that the transformer can withstand is 1% of the fundamental current at rated power.
• For thermal rating, the load curve of the transformer and environment conditions should be taken into account.
• The apparent power of the inverter should never exceed the power of the transformer. The maximum AC current of all inverters connected in parallel must be taken into account. If more than 25 inverters are connected to the grid, contact SUNGROW.
• The transformer must be protected against overloading and short circuit.
• The transformer is an important part of grid-connected PV generation system. The fault tolerance capacity of the transformer should be taken into account at all times. The fault include: system short circuit, grounding fault, voltage drop, etc.
• Take ambient temperature, relative humidity, altitude, air quality, and other environment conditions into account when selecting and installing the transformer.
• When the anti-PID function is enabled, observe the following items:
  – If the LV side winding is in Y shape, neutral point grounding is prohibited.
  – Surge protective devices (SPD) for the AC combiner box and on the LV side of the transformer are recommended to be connected in the "3+1" manner, as shown in the figure below. The Min. continuous operating voltages of M1-M4 are 750VAC.
  – The LV side winding of the transformer, AC cables, and secondary devices (including protective relay, detection and measurement instruments, and related auxiliary devices) must withstand the voltage to ground of at least 1,500V.
5.6.2 Requirements for OT/DT Terminal

OT/DT terminals (not included in the delivery scope) are required for fixing AC cables to the terminal block. Purchase the OT/DT terminals according to the following requirements.

- Specification: M12;
- Dimensions: $a \leq 46\, \text{mm} / 13\, \text{mm} \leq b \leq 15.5\, \text{mm} / c \leq 22\, \text{mm}$

![Dimensions of Terminal](image)

Fig. 5-2 Dimensions of Terminal

5.6.3 Aluminium Cable Requirements

If an aluminium cable is selected, use a copper to aluminium adapter terminal to avoid direct contact between the copper bar and the aluminium cable.

![Aluminium cable terminal connection sequence](image)

Fig. 5-3 Aluminium cable terminal connection sequence
NOTICE

- Ensure that the selected terminal can directly contact with the copper bar. If there are any problems, contact the manufacturer of terminal.
- Direct contact between the copper bar and the aluminium cable will cause electrochemical corrosion and impair the reliability of electrical connection.

5.6.4 Wiring Procedure

Step 1 Open the wiring compartment. For details, refer to 5.5 Opening the Wiring Compartment

Step 2 Disconnect the AC-side circuit breaker and prevent it from inadvertent reconnection.

Step 3 Loosen the swivel nut of the AC gland terminal and select an appropriate seal according to cable outer diameter. Lead the cable through the swivel nut and seal successively.

Step 4 Strip the protection layer and insulation layer by specific length, as described in the figure below.

Step 5 If wiring of tracking system power cable is required, refer to 5.8 Wiring of Tracking System Power Cable (Optional). Otherwise, skip performing this step.

Step 6 Crimp the OT/DT terminals.
Step 7 Secure the wires to corresponding terminals.

Step 8 Gently pull the cable backwards to ensure firm connection, and fasten the swivel nut clockwise.
5.7 PV String Connection

⚠️ DANGER
Electric shock!
- The PV array will generate lethal high voltage once exposed to sunlight.

⚠️ WARNING
Make sure the PV array is well insulated to ground before connecting it to the inverter.

NOTICE
There is a risk of inverter damage! The following requirements should be met. Failure to do so will void guarantee and warranty claims.
- Make sure the voltage of each string does not exceed 1500V at all times.
- Make sure the maximum short circuit current on the DC side is within the permissible range.
- Make sure the to-ground insulation performance of the PV string is sound.

5.7.1 PV Input Configuration
As shown in the figure below, the inverter is provided with multiple PV inputs and each PV input is designed with an MPP tracker.
Each PV input operates independently and has its own MPPT. In this way, string structures of each PV input may differ from each other, including PV module type, number of PV modules in each string, angle of tilt, and installation orientation.

Each PV input area includes two DC inputs DC1 and DC2. To make the best use of PV module input power, string structures of DC1 and DC2 should be the same, including PV module type, number of PV modules, angle of tilt, and installation orientation.

**NOTICE**

To make the best use of PV input power, PV string structure of the same input should be the same in PV module type, PV module number, angle of tilt, and orientation.

<table>
<thead>
<tr>
<th>Open circuit voltage limit</th>
<th>Max. current for input connector</th>
</tr>
</thead>
<tbody>
<tr>
<td>1,500V</td>
<td>30A</td>
</tr>
</tbody>
</table>

The PV input needs to be connected via a plug-in PV input terminal which is included in the scope of delivery.

DC cable on the PV string side should be connected via the PV connector which is included in the scope of delivery.
To ensure IP66 protection, use only the connector within the scope of delivery or the connector with the same ingress of protection.

### 5.7.2 Connection Procedure

**DANGER**

High voltage may be present in the inverter!
- Ensure all cables are voltage-free before performing electrical operations.
- Do not connect the AC circuit breaker before finishing electrical connection.

**NOTICE**

Use the UTX DC terminal within the scope of delivery. Damage to the device due to the use of incompatible terminal shall not be covered by the warranty.

**Step 1** Strip insulation layers of all DC cables by about 7mm.

**Step 2** Assemble the cable ends with the crimping pliers.

**Step 3** Lead the cable through cable gland, and insert into the insulator until it snaps into place. Gently pull the cable backward to ensure firm connection. Tighten the cable gland and the insulator (torque 2.5 N·m to 3 N·m).

**Step 4** Check for polarity correctness.
5.7.3 Installing the PV Connectors

**Step 1** Rotate the DC switch to "OFF" position.

**Step 2** Check the cable connection of the PV string for polarity correctness and ensure that the open circuit voltage in any case does not exceed the inverter input limit of 1,500V.

**Step 3** Insert the PV connectors to the corresponding terminals until there is an audible click.

**NOTICE**

Check the positive and negative polarity of the PV strings, and insert the PV connector to the corresponding terminal only after ensuring polarity correctness.

Arc or contactor over-temperature may occur if the PV connectors are not firmly in place, and damage caused shall not be covered by the warranty.

**Step 4** Follow the foregoing steps to connect PV connectors of other PV strings.

**Step 5** Seal the unused PV terminals with UTX terminal caps.
5.8 Wiring of Tracking System Power Cable (Optional)

**Step 1** Lead the AC cable into the wiring compartment according to Step 1 to Step 4 described in 5.6.4 Wiring Procedure.

**Step 2** Loosen the swivel nut of the communication terminal and select an appropriate seal according to cable outer diameter. Lead the cable through the swivel nut and seal successively.

<table>
<thead>
<tr>
<th>Outer diameter D(mm)</th>
<th>Seal</th>
</tr>
</thead>
<tbody>
<tr>
<td>4.5mm~6mm</td>
<td>c</td>
</tr>
<tr>
<td>6mm~12 mm</td>
<td>a+b</td>
</tr>
<tr>
<td>13 mm~18 mm</td>
<td>b</td>
</tr>
</tbody>
</table>

**Step 3** Strip the protection layer and insulation layer by specific length, as described in the figure below.

**Step 4** Crimp tracking system power wires together with two phase wires in the AC cable. Other AC wires are crimped independently.
Step 5 Secure the wires to corresponding terminals.

Step 6 Gently pull the cable backwards to ensure firm connection, and fasten the swivel nut clockwise.
5.9 RS485 Communication

5.9.1 Communication Wiring Board

The following figure shows the position of the communication wiring board in the inverter as well as the terminals equipped for the wiring board.

The inverter is equipped with two groups of RS485 communication interfaces for external communication connection. Both the two groups of interfaces can be connected to the data collector (Logger), to achieve data exchange with PC or other monitoring devices.

When multiple inverters are connected in the RS485 daisy chain, a 120Ω terminating resistor can be connected between the A and B communication cable through the RS485-dip switch, to ensure communication quality.

5.9.2 RS485 Communication System

Single-inverter communication system

In case of a single inverter, communication cable connection requires only one RS485 cable.
Multi-inverter communication system
In case of multiple inverters, all the inverters can be connected via RS485 cables in the daisy chain manner.

When wiring multiple inverters, one of the two communication interfaces RS485_1 and RS485_2 can be chose, but not both.
When more than 15 inverters are connected on the same daisy chain, the inverters on two ends of the chain should be equipped with terminal resistors of 120Ω to ensure communication quality by configuring the dip switch (SW1), and the shielding layer of the communication cable should be single-point grounded.
• The length of the RS485 cable should be no longer than 1,200m.
• If multiple inverters are connected to the data acquisition device Logger3000, the number of permissible daisy chains and the number of devices allowed to be connected should meet the requirements (refer to the user manual for the Logger3000).

5.9.3 Wiring Procedure

• RS485 communication cables should be shielded twisted pair cables or Shielded twisted pair Ethernet cables.
• There are four RS485 communication terminals COM1, COM2, COM3 and COM4 on the bottom of the inverter. Please choose according to the actual situation.

**Step 1** Strip the cable jacket and insulation layer by appropriate length.

[Diagram of stripped cable]

**Step 2** Loosen the swivel nut of the communication terminal and select an appropriate seal according to cable outer diameter. Lead the cable through the swivel nut and seal successively.

[Diagram of cable with swivel nut and seal]

---

### 5.10 Dry Contact Connection

Dry contact cables require a cross-sectional area of 1 mm² to 1.5 mm². The connection procedure of the dry contact is the same as that of the RS485 terminal block.

#### 5.10.1 Dry Contact Function

The communication circuit board is provided with DO terminal (fault output dry contact) and DI terminal (emergency stop dry contact), as shown in the figure below.
DO terminal (fault output dry contact): the relay can be set to fault alarm output, and user can configure it to be a normal open contact (COM&NO) or a normal close contact (COM&NC).

The relay is initially at the NC terminal, and it will trip to another contact when a fault occurs.

Use LED indicators or other equipment to indicate whether the inverter is in the faulty state. The following figures show the typical applications of normal open contact and normal close contact:

**Fig. 5-6 Normal open contact**
Devices connected to the relay should comply with related requirements:

<table>
<thead>
<tr>
<th>AC-Side Requirements</th>
<th>DC-Side Requirements</th>
</tr>
</thead>
<tbody>
<tr>
<td>Max. voltage: 250Vac</td>
<td>Max. voltage: 30Vdc</td>
</tr>
<tr>
<td>Max. current: 5A</td>
<td>Max. current: 5A</td>
</tr>
</tbody>
</table>

**DI terminal (emergency stop dry contact):** the dry contact can be configured to be an emergency stop contact.

When the DI contact and GND contact are shorted by external control switch, the inverter will immediately stop.

- **The dry contacts only support passive switch signal input.**

The following figure shows the typical application of local stop dry contact.

**NOTICE**

Ensure that the impedance at the input node is less than 600Ω.

**5.10.2 Wiring Procedure**

Refer to the wiring of terminal block described in chapter 5.9.3 Wiring Procedure.
5.11 Closing the Wiring Compartment

**Step 1** Release the limit lever.

**Step 2** Close the wiring compartment and tighten the two screws on its front cover with supplied Allen wrench.

In case the screws on the cover are missing, you can find spare ones in the scope of delivery.
6 Commission

6.1 Inspection before Commissioning

Check the following items before starting the inverter:

- The inverter DC switch and external circuit breaker are disconnected.
- The inverter should be accessible for operation, maintenance and service.
- Nothing is left on the top of the inverter or battery pack.
- The inverter is correctly connected to the external devices, and the cables are routed in a safe place or protected against mechanical damage.
- The selection of the AC circuit breaker is in accordance with this manual and all applicable local standards.
- All unused terminals at the bottom of the inverter are properly sealed.
- Warning signs & labels are suitably affixed and durable.

6.2 Commissioning Procedure

If all of the items mentioned above meet the requirements, proceed as follows to start up the inverter for the first time.

Step 1 Rotate the DC switch of the inverter to "ON" position.
Step 2 Connect the AC switch (if applicable) between the inverter and the grid.
Step 3 Connect the DC switch (if applicable) between the inverter and the PV string.
Step 4 Set initial protection parameters via the iSolarCloud APP. For details, please refer to "7.4 Login". If the irradiation and grid conditions meet requirements, the inverter will normally operate.
Step 5 Observe the LED indicator to ensure that the inverter operates normally. (Refer to Tab. 2-2LED indicator description).
7 iSolarCloud APP

7.1 Brief Introduction

The iSolarCloud APP can establish communication connection to the inverter via the Bluetooth, thereby achieving near-end maintenance on the inverter. Users can use the APP to view basic information, alarms, and events, set parameters, or download logs, etc.

*In case the communication module Eye or WiFi is available, the iSolarCloud APP can also establish communication connection to the inverter via the mobile data or WiFi, thereby achieving remote maintenance on the inverter.

- This manual describes only how to achieve near-end maintenance via the Bluetooth connection. For remote maintenance through the Eye or WiFi, refer to the related manuals in the delivery scope.
- Screenshots in this manual are based on the Android system V2.1.5, and the actual interfaces may differ.

7.2 Download and Install

Method 1

Download and install the APP through the following application stores:

- MyApp (Android, mainland China users)
- Google Play (Android, users other than mainland China ones)
- APP store (iOS)

Method 2

Scan the following QR code to download and install the APP according to the prompt information.
The APP icon appears on the home screen after installation.

### 7.3 Menu

![Menu tree diagram](image)

*Fig. 7-1 Menu tree*

### 7.4 Login

#### 7.4.1 Requirements

The following items should meet requirements:

- The AC and DC sides or the AC side of the inverter is powered-on.
• The mobile phone is within 5m away from the inverter and there are no obstructions in between.
• The Bluetooth function of the mobile phone is enabled.

### 7.4.2 Login Steps

**Step 1** Open the APP to enter the login interface, and click "Direct Login" to enter the next screen.

**Step 2** Open the APP, after which the Bluetooth search screen pops up automatically, and select the to-be-connected inverter according the SN on the nameplate of the inverter. The Bluetooth indicator gets on once the connection is established. Alternatively, tap 📦 to scan the QR code on the side of the inverter to establish Bluetooth connection.

![Fig. 7-2 Bluetooth connection](image)

**Step 3** Enter the login screen after the Bluetooth connection is established.

![Fig. 7-3 Login](image)
• The username is “user”, the initial password is "pw1111" which should be changed for the consideration of account security.
• To set inverter parameters related to grid protection and grid support, contact SUNGROW to obtain the advanced account and corresponding password.

**Step 4** If the inverter is not initialized, you will enter the quick setting screen of initialize protection parameter. After finishing setting on the quick setting screen, click “Boot” and the device will be initialized. The APP will send start instructions and the device will start and operate.

![Initialization protection parameter](image)

**Fig. 7-4** Initialization protection parameter

**NOTICE**

Reset the protection parameters if the country setting is incorrect. Otherwise, fault may occur.

**Step 5** If the inverter is initialized, the APP automatically turns to its home page.

### 7.5 Home page

After login, the home page is as follows:

### 7.7 History Record

Tap "_HISTORY" on the navigation bar to enter the history record screen, as shown in the following figure.

![History Record](image)

**Fig. 7-7 History record**

On "history record" screen, users can check the alarm records, power yield records and event records.

#### 7.7.1 Fault Alarm Records

Tap "_ALARM" to view fault and alarm records, as shown in the following figure.

![Alarm Records](image)

**Fig. 7-8 Fault and alarm records**

- Click " " to select a time segment and view corresponding records.
- The inverter can record up to 400 latest entries.

Select one of the records in the list and click the record, to view the detailed fault
info as shown in following figure.

![Detailed fault alarm info](image)

**Fig. 7-9** Detailed fault alarm info

### 7.7.2 Power Yields Records

User can view various energy records: power curve, daily energy histogram, daily energy histogram, monthly energy histogram, and annual energy histogram.

**Tab. 7-5** Explanation of power yields records

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Power curve</td>
<td>Show the power output from 5 am to 11 pm in a single day. Each point in the curve is the percentage of present power and nominal power.</td>
</tr>
<tr>
<td>Daily energy histogram</td>
<td>Shows the power output every day in the present month.</td>
</tr>
<tr>
<td>Monthly energy histogram</td>
<td>Shows the power output every month in a year.</td>
</tr>
<tr>
<td>Annual energy histogram</td>
<td>Shows the power output every year.</td>
</tr>
</tbody>
</table>

Click the “🔗 Energy records” to view the power curve page as shown in following figure.
Fig. 7-10 Power curve

Tap the time bar on the top of the screen to select a time segment and view the corresponding power curve.

**Step 2** Swipe left to check the power yields histogram

### 7.7.3 Event Records

Click "Event record" to view event record list.

- Click "" to select a time segment and view corresponding event records.
- The inverter can at most record the latest 400 events

### 7.8 More

Tap "More" on the navigation bar to enter the "More" screen, as shown in the following figure.
7.8.1 Parameter Setting

Tap "Settings" to enter the parameter setting screen, as shown in the following figure.

Tap "System parameter" to enter the system parameter screen on which start/stop instruction can be sent to the inverter and information such as ARM version and MDSP version can be viewed.

7.8.2 Password Changing

Tap "Modify password" to enter the modify password screen, as shown in the following figure.

The new password should consist of 6 characters, a combination of letters and digits.
8 System Decommissioning

8.1 Disconnecting the Inverter

For maintenance or other service work, the inverter must be switched off.

Proceed as follows to disconnect the inverter from the AC and DC power sources. Lethal voltages or damage to the inverter will follow if otherwise.

**Step 1** Disconnect the external AC circuit breaker or disconnect to prevent it from accidentally reconnecting to the utility grid.

**Step 2** Rotate the DC switch to the “OFF” position for disconnecting all of the PV string inputs.

**Step 3** Wait about 5 minutes until the capacitors inside the inverter have been discharged.

**Step 4** Ensure that the DC cable is current-free via a current clamp.

**Step 5** Insert a UTX wrench into the notch and press the wrench with an appropriate force to remove the DC connectors.

**Step 6** Open the wiring compartment, and ensure that the AC cables are voltage-free by using a multimeter.

**Step 7** Remove AC cables and communication cables, and close the wiring compartment.

**Step 8** Install the UTX waterproof plugs.

For further disconnection and reconnection instructions, please visit the webpage of respective component manufacturer.

8.2 Dismantling the Inverter

Refer to Chapter 5 and Chapter 6 to dismantle the inverter in reverse steps.

**CAUTION**

Risk of burns and electric shock!

Do not touch any inner live parts until at least 5 minutes after disconnecting the inverter from the utility grid and the PV input.
8.3 Disposal of the Inverter

Users take the responsibility for the disposal of the inverter.

NOTICE
If the inverter will be reinstalled in the future, store it properly by referring to “3.4 Inverter Storage”.

NOTICE
Some parts and devices of the inverter, such as the capacitors, may cause environment pollution.
Do not dispose of the product together with household waste but in accordance with the disposal regulations for electronic waste applicable at the installation site.
9 Troubleshooting and Maintenance

9.1 Troubleshooting

Once a fault occurs in the inverter, the fault information can be displayed on the APP interface.

Fault codes and check methods are as follows:

<table>
<thead>
<tr>
<th>Fault code</th>
<th>Description</th>
<th>Check method</th>
</tr>
</thead>
</table>
| 002        | Grid overvoltage, The grid voltage is higher than the set protection value. | Generally, the inverter will be reconnected to the grid after the grid returns to normal. If the fault occurs repeatedly:
1. Measure the actual grid voltage, and contact the local electric power company for solutions if the grid voltage is higher than the set value.
2. Check whether the protection parameters are appropriately set via the APP or the LCD.
3. Check whether the cross-sectional area of the AC cable meets the requirement.
4. If the fault is not caused by the foregoing reasons and still exists, contact Sungrow Service. |
| 003        | Grid transient overvoltage, The transient grid voltage is higher than the standard value. | Generally, the inverter will be reconnected to the grid after the grid returns to normal. If the fault occurs repeatedly, contact Sungrow Service. |
| 004        | Grid undervoltage, The grid voltage is lower than the set protection value | Generally, the inverter will be reconnected to the grid after the grid returns to normal. If the fault occurs repeatedly:
1. Measure the actual grid voltage, and contact the local electric power company for solutions if the grid voltage is lower than the set value.
2. Check whether the protection parameters are appropriately set via the APP or the LCD.
3. Check whether the AC cable is firmly in place.
4. If the fault is not caused by the foregoing reasons and still exists, contact Sungrow Service. |
<table>
<thead>
<tr>
<th>Fault code</th>
<th>Description</th>
<th>Check method</th>
</tr>
</thead>
</table>
| 005       | Grid low voltage, The grid voltage is lower than the set protection value  | Generally, the inverter will be reconnected to the grid after the grid returns to normal. If the fault occurs repeatedly:  
1. Measure the actual grid voltage, and contact the local electric power company for solutions if the grid voltage is lower than the set value.  
2. Check whether the protection parameters are appropriately set via the APP or the LCD.  
3. Check whether the AC cable is firmly in place.  
4. If the fault is not caused by the foregoing reasons and still exists, contact Sungrow Service. |
| 007       | AC instantaneous overcurrent, AC output current exceeds the upper limit of the inverter. | Generally, the inverter will be reconnected to the grid after the grid returns to normal. If the fault occurs repeatedly, contact Sungrow Service. |
| 008       | Grid overfrequency, Grid frequency exceeds the upper limit of the inverter. | Generally, the inverter will be reconnected to the grid after the grid returns to normal. If the fault occurs repeatedly:  
1. Measure the actual grid frequency, and contact the local electric power company for solutions if the grid frequency is beyond the set range.  
2. Check whether the protection parameters are appropriately set via the APP or the LCD.  
3. If the fault is not caused by the foregoing reasons and still exists, contact Sungrow Service. |
| 009       | Grid underfrequency, Grid frequency is lower than the lower limit of the inverter. | Generally, the inverter will be reconnected to the grid after the grid returns to normal. If the fault occurs repeatedly:  
1. Check whether the grid supplies power reliably.  
2. Check whether the AC cable is firmly in place.  
3. Check whether the AC cable is connected to the correct terminal (whether the live wire and the N wire are correctly in place).  
4. Check whether the AC circuit breaker is connected.  
5. If the fault is not caused by the foregoing reasons and still exists, contact Sungrow Service. |
<p>| 010       | Grid power outage, AC switch or circuit is disconnected.                    | Wait for the inverter to return to normal. Disconnect the AC and DC switches, and reconnect the AC and DC switches 15 minutes later to restart the inverter. If the fault still exists, contact Sungrow Service. |
| 011       | Device anomaly                                                              | Wait for the inverter to return to normal. Disconnect the AC and DC switches, and reconnect the AC and DC switches 15 minutes later to restart the inverter. If the fault still exists, contact Sungrow Service. |</p>
<table>
<thead>
<tr>
<th>Fault code</th>
<th>Description</th>
<th>Check method</th>
</tr>
</thead>
</table>
| 012        | Excessive leakage current | 1. The fault can be caused by poor sunlight or damp environment, and the inverter will be reconnected to the grid after the environment is improved.  
2. If the environment is normal, check whether the AC and DC cables are well insulated.  
3. If the fault is not caused by the foregoing reasons and still exists, contact Sungrow Service. |
| 013        | Grid abnormal, the grid voltage or frequency is out of the permissible range, and the inverter cannot be connected to the grid normally. | Generally, the inverter will be reconnected to the grid after the grid returns to normal. If the fault occurs repeatedly:  
1. Measure the actual grid frequency, and contact the local electric power company for solutions if the grid parameter exceeds the set value.  
2. If the fault is not caused by the foregoing reasons and still exists, contact Sungrow Service. |
| 014        | 10-minute grid overvoltage, the grid voltage exceeds the preset AC voltage of the inverter for a long time. | Wait for the inverter to return to normal. If the fault occurs repeatedly, contact Sungrow Service. |
| 015        | Grid overvoltage, the grid voltage is higher than the set protection value | Generally, the inverter will be reconnected to the grid after the grid returns to normal. If the fault occurs repeatedly:  
1. Measure the actual grid voltage, and contact the local electric power company for solutions if the grid voltage is higher than the set value.  
2. Check whether the protection parameters are appropriately set via the APP or the LCD.  
3. Check whether the cross-sectional area of the AC cable meets the requirement.  
4. If the fault is not caused by the foregoing reasons and still exists, contact Sungrow Service. |
<p>| 016        | Output overload, the configured module power is excessively large and out of the normal operation range of the inverter. | Wait for the inverter to return to normal. If the fault still exists, contact Sungrow Service. |</p>
<table>
<thead>
<tr>
<th>Fault code</th>
<th>Description</th>
<th>Check method</th>
</tr>
</thead>
</table>
| 017       | Grid voltage unbalance, the inverter detects unbalanced three-phase grid voltage | Generally, the inverter will be reconnected to the grid after the grid returns to normal. If the fault occurs repeatedly:  
1. Measure the actual grid voltage. If grid phase voltages differ greatly, contact the power company for solutions.  
2. If the voltage difference between the three phases is within the permissible range of the local power company, modify the grid voltage imbalance parameter through the APP or LCD screen.  
3. If the fault is not caused by the foregoing reasons and still exists, contact Sungrow Service. |
| 019-020   | Device anomaly                                                              | Wait for the inverter to return to normal. Disconnect the AC and DC switches, and reconnect the AC and DC switches 15 minutes later to restart the inverter. If the fault still exists, contact Sungrow Service. |
| 021-022   | Device anomaly                                                              | Wait for the inverter to return to normal. Disconnect the AC and DC switches, and reconnect the AC and DC switches 15 minutes later to restart the inverter. If the fault still exists, contact Sungrow Service. |
| 024-025   | Device anomaly                                                              | Wait for the inverter to return to normal. Disconnect the AC and DC switches, and reconnect the AC and DC switches 15 minutes later to restart the inverter. If the fault still exists, contact Sungrow Service. |
| 030-034   | Device anomaly                                                              | Wait for the inverter to return to normal. Disconnect the AC and DC switches, and reconnect the AC and DC switches 15 minutes later to restart the inverter. If the fault still exists, contact Sungrow Service. |
| 036       | Temperature anomaly, The temperature of the power module or the interior of the inverter is excessively high and out of the safe range. | 1. Check whether the inverter is directly exposed to sunlight. If so, take some shading measures.  
2. Check and clean the air ducts.  
3. Check whether there is 070 (fan anomaly) alarm via the APP or the LCD. If so, replace the fans. |
| 037       | Temperature anomaly, The temperature of the power module or the interior of the inverter is excessively high and out of the safe range. | 1. Check whether the inverter is directly exposed to sunlight. If so, take some shading measures.  
2. Check and clean the air ducts.  
3. Check whether there is 070 (fan anomaly) alarm via the APP or the LCD. If so, replace the fans. |

### 9.2 Maintenance

<table>
<thead>
<tr>
<th>DANGER</th>
</tr>
</thead>
</table>
| **Risk of inverter damage or personal injury due to incorrect service!**  
Always keep in mind that the inverter is powered by dual sources: PV strings and utility grid.  
Before any service work, observe the following procedure.  
- Disconnect the AC circuit breaker and then set the DC load-break switch of the inverter to OFF;  
- Wait at least 10 minutes for inner capacitors to discharge completely;  
- Verify that there is no voltage or current before pulling any connector. |

<table>
<thead>
<tr>
<th>CAUTION</th>
</tr>
</thead>
</table>
| **Keep non-related persons away!**  
A temporary warning sign or barrier must be posted to keep non-related persons away while performing electrical connection and service work. |

<table>
<thead>
<tr>
<th>NOTICE</th>
</tr>
</thead>
</table>
| **Risk of inverter damage if it is improperly serviced.**  
Use accessories and spare parts approved by the inverter manufacturer only. Never modify the inverter or other components of the inverter.  
Unauthorized alterations will void guarantee and warranty claims and in most cases terminate the operating license. SUNGROW shall not be held liable for any damage caused by such changes. |

<table>
<thead>
<tr>
<th>NOTICE</th>
</tr>
</thead>
</table>
| **Any malfunction that may impair the inverter safety operation must be repaired immediately before the inverter is restarted.**  
Inverter contains no customer serviceable parts inside. Please contact local authorized personnel if any service work is required. |
9.2.1 Routine Maintenance

<table>
<thead>
<tr>
<th>Item</th>
<th>Method</th>
<th>Period</th>
</tr>
</thead>
</table>
| System clean      | Check the temperature and dust of the inverter. Clean the inverter enclosure if necessary.  
Check if the air inlet and outlet are normal. Clean the air inlet and outlet, if necessary. | Six months to a year (depend on the dust contents in air) |
| Fans              | Check whether there is fan warning using APP.  
Check whether there is any abnormal noise when the fan is turning.  
Clean or replace the fans if necessary (see the following section). | Once a year |
| Cable entry       | Check whether the cable entry is insufficiently sealed or the gap is excessively large, and reseal the entry when necessary. | Once a year |
| Electrical Connection | Check whether all cable are firmly in place.  
Check whether a cable is damaged, especially the part contacting the metal enclosure. | Six months to a year |

9.2.2 Maintenance Instruction

Fan Maintenance

**DANGER**

- Stop the inverter and disconnect it from all power supplies before maintenance.
- Lethal voltage still exists in the inverter. Please wait for at least 5 minutes and then perform maintenance work.
- Only qualified electricians can maintain the fans.

Fans inside the inverter are used for heat dissipation. If the fans do not operate normally, the inverter may not be cooled down and inverter efficiency may compromise. Therefore, it is necessary to clean the dirty fans and replace the broken fans in time.

The operation procedure is as follows:

**Step 1** Stop the inverter (see 8.1 Disconnecting the Inverter).

**Step 2** Loosen the screw on the sealing plate of the fan module.
**Step 3** Press the hump of the latch hook, unplug the cable connection joint outwards, and loosen the screw on the fan holder.

**Step 4** Pull out the fan module, clean the fans with soft brush or vacuum cleaner, and replace them when necessary.

**Step 5** Follow the steps above to remove the fan on the other side of the inverter.
**Step 6** Reinstall the fans back to the inverter in reverse order, and restart the inverter.
Cleaning Air Inlet and Outlet

A huge amount of heat is generated in the process of running the inverter. The inverter adopts a controlled forced-air cooling method.

In order to maintain good ventilation, please check to make sure the air inlet and outlet are not blocked.

Clean the air inlet and outlet with soft brush or vacuum cleaner if necessary.

### Compliance

### 10.2 Quality Assurance

When product faults occur during the warranty period, SUNGROW will provide free service or replace the product with a new one.

### Evidence

During the warranty period, the customer shall provide the product purchase invoice and date. In addition, the trademark on the product shall be undamaged and legible. Otherwise, SUNGROW has the right to refuse to honor the quality guarantee.

### Conditions

- After replacement, unqualified products shall be processed by SUNGROW.
• The customer shall give SUNGROW a reasonable period to repair the faulty device.

**Exclusion of Liability**

In the following circumstances, SUNGROW has the right to refuse to honor the quality guarantee:

• The free warranty period for the whole machine/components has expired.
• The device is damaged during transport.
• The device is incorrectly installed, refitted, or used.
• The device operates in harsh environment, as described in this manual.
• The fault or damage is caused by installation, repairs, modification, or disassembly performed by a service provider or personnel not from SUNGROW.
• The fault or damage is caused by the use of non-standard or non-SUNGROW components or software.
• The installation and use range are beyond stipulations of relevant international standards.
• The damage is caused by unexpected natural factors.

For faulty products in any of above cases, if the customer requests maintenance, paid maintenance service may be provided based on the judgment of SUNGROW.
## 10.3 Contact Information

Should you have any question about this product, please contact us.

We need the following information to provide you the best assistance:

- Type of the inverter
- Serial number of the inverter
- Fault code/name
- Brief description of the problem
